

**LISTING OF CLAIMS:** No amendments made herein.

1. (PREVIOUSLY PRESENTED) A computer application managing method for a case where a plurality of computer applications are stored in a computer-readable storage at locations of the storage, the method comprising:

electronically storing, in the computer-readable storage, a directory structure corresponding to the plurality of applications;

in the computer-readable storage, giving information of the application addresses directly to directories of the directory structure, respectively, the application address information being for identifying the applications, respectively, where the applications are needed for corresponding data files stored in the computer-readable storage using the directories, respectively; and

electronically performing management so that when one of the data files is selected a needed application corresponding to the data file of a directory of the directories is automatically selected and executed by referring to the selected data file's directory to obtain its application's address information and therewith access and execute the application at the computer-readable storage location of the thus-obtained address information given to the directory, where the selection for execution is responsive to the data file of the directory being selected,

wherein one of the plurality of applications is needed when one of the data files is selected.

2. (CANCELED)

3. (PREVIOUSLY PRESENTED) The computer application managing method, according to claim 1, further comprising:

preparing an application management table storing the information of the application addresses; and

referring to the application management table when a directory of the directories is selected, so as to recognize a starting address of an application of the plurality of applications, the starting address corresponding to an item of the application address information given to the directory of the directories, and to access the application of the plurality of applications.

4. (PREVIOUSLY PRESENTED) The computer application managing method, according to claim 1, further comprising:

storing size information at a starting address of each application of the plurality of applications, the size information indicating a size of the application of the plurality of applications; and

repeating detection of the size of an application of the plurality of applications from the size information stored in the starting address of the application of the plurality of applications, and search for a starting address of a next application of the plurality of applications in accordance with the size of the preceding application of the plurality of applications, so as to obtain the starting address of a desired application of the plurality of applications.

5. (PREVIOUSLY PRESENTED) The computer application managing method, according to claim 1, wherein an item of the information of the application addresses is given to the highest directory of the directory structure.

6. (PREVIOUSLY PRESENTED) The application managing method, according to claim 1, wherein an item of the information of application addresses is given to each directory of the directory structure.

7. (PREVIOUSLY PRESENTED) The computer application managing method, according to claim 1, wherein, when an application of the plurality of applications is substantially deleted, an item of the information of the application addresses for the application of the plurality of applications is caused to be ineffective.

8. (PREVIOUSLY PRESENTED) The computer application managing method, according to claim 1,

wherein when an application of the plurality of applications is updated, an application obtained from updating the application of the plurality of applications is added to the plurality of applications, and

wherein an item of the information of the application addresses for identifying the application of the plurality of applications is changed to an item of identification information for identifying the application obtained from updating the application of the plurality of applications.

9-11. (CANCELED)

12. (PREVIOUSLY PRESENTED) An information processing apparatus, storing a plurality of applications at addresses of a computer-readable storage, comprising:

a directory structure, in the computer-readable storage, comprising a plurality of directories corresponding to the plurality of applications independently of whether a directory in the directory structure is a subordinate directory or a highest directory,

wherein, in the computer-readable storage, information of the application addresses are given directly to the directories of the directory structure, respectively, the application address information identifying the applications, respectively, where the applications are needed for corresponding data files, and where the data files are organized and stored in the computer-readable storage using the directories of the directory structure,

wherein one of the plurality of applications is needed when one of the data files is selected.

13. (CANCELED)

14. (PREVIOUSLY PRESENTED) The information processing apparatus according to claim 12, further comprising:

an application management table that stores the information of the application addresses.

15. (PREVIOUSLY PRESENTED) The information processing apparatus, according to claim 12, wherein an item of the information of the application addresses is given to one of the highest directory of the directory structure, the most subordinate directly of the directory structure, or a master directory of the directory structure.

16. (PREVIOUSLY PRESENTED) The information processing apparatus, according to claim 12, wherein an item of the information of the application addresses is given to each directory of the directory structure.

17. (CANCELED)

18. (WITHDRAWN) A method, comprising:  
storing a file structure on an IC (integrated circuit) card, wherein each of a plurality of data files in the file structure corresponds respectively to one of a plurality of applications that are stored on the IC card;

receiving a selection of one of the plurality of data files; and  
executing one of the plurality of applications, which corresponds to the one of the plurality of data files, based on one of a corresponding plurality of starting addresses that are stored directly with directory structures in the file structure by accessing a directory structure to obtain a starting address in response to the receiving the selection of the one of the plurality of

files.

19. (WITHDRAWN) A volatile or non-volatile computer-readable storage storing a file system, the file system comprising:

two or more executable application files each stored at a different respective address in the storage;

two or more hierarchical directory structures comprising hierarchically linked directory structure nodes;

each hierarchical directory structure having directly-stored with one or more directory structure nodes thereof information of the address of an application with which the directory structure is associated; and

each hierarchical directory structure storing one or more data files associated with the application whose address information is directly-stored with the hierarchical file directory structure, where the hierarchical directory structures and the data files are separate and the data files are linked to the hierarchical directory structures, and where an application is associated with a directory because it is needed when a data file of the directory is selected.

20. (WITHDRAWN) A storage and file system according to claim 19, wherein the application files are not stored in the hierarchical file directories.

21. (WITHDRAWN) A method of using a storage and file system according claim 19, comprising:

accessing one of the data files and in response automatically checking directory structure nodes of the data file's hierarchical file directory to find the directory's directly-stored address and in further response using the so found address to execute an application at the found address.

22. (WITHDRAWN) A method of using a storage and file system according claim 20, comprising:

accessing one of the data files and in response automatically checking directory structure nodes of the data file's hierarchical file directory to find the directory's directly-stored address and in further response using the so found address to execute an application at the found address.

23. (PREVIOUSLY PRESENTED) A method according to claim 1, wherein the

directories are predetermined.

24. (PREVIOUSLY PRESENTED) A method according to claim 1, wherein the computer-readable storage comprises a memory card.

25. (PREVIOUSLY PRESENTED) A method according to claim 24, wherein the memory card comprises an IC card.

26. (PREVIOUSLY PRESENTED) A method according to claim 12, wherein the directories are predetermined.

27. (PREVIOUSLY PRESENTED) A method according to claim 12, wherein the computer-readable storage comprises a memory card.

28. (PREVIOUSLY PRESENTED) A method according to claim 27, wherein the memory card comprises an IC card.

29. (PREVIOUSLY PRESENTED) An information processing apparatus, comprising:  
a computer-readable storage storing a plurality of applications at addresses of, the plurality of applications comprising: a directory structure in the computer-readable storage corresponding to the plurality of applications,

wherein in the computer-readable storage information of the application addresses are given directly to directories of the directory structure, respectively, the application address information identifying the applications, respectively, where the applications are needed for corresponding data files, and where the data files are organized and stored in the computer-readable storage using the directories of the directory structure,

and a controller performing management so that when one of the data files is selected a needed application corresponding to the data file of a directory of the directories is automatically selected and executed by referring to the selected data file's directory to obtain its application's address information and therewith access and execute the application at the computer-readable storage location of the thus-obtained address information given to the directory, where the selection for execution is responsive to the data file of the directory being selected

wherein one of the plurality of applications is needed when one of the data files is selected.
